| 1550 | 50f on 35000z | <i>Termitomyces aurantiacus</i> | Amanitaceae |
|------|---------------|---------------------------------|-------------|

And a correction:

Received a note from Zdenek Moravec in Czechoslovakia, a member of the Czech Topical Society. In this note Mr. Moravec notes that in Biophilately 52(3): 115 I had shown “No listing in my Ainsworth & Bisby (7th)” for the family associated with *Cryptotrama asprata*. Ah well... I was right and wrong at the same time, as he gently points out. Indeed there is no family name associated with *Cryptotrama*; however, if I had spelled the genus correctly I would have found that *Cryptotrama* Singer (1960) is in the family Tricholomataceae. So, for those of you who try to keep these things straight – correct the name of the genus and add the appropriate family name to the citation. And, thanks Mr. Moravec for the correction.
